                                                                                                                                                                                                                                            ö
                           This is the amino acid sequence of the sunA protein encoded by the prosublancin 168 nucleotide sequence used in the method of the invention. The peptide designated sublancin 168, is an antimicrobial useful for treating infections and preserving food against spoilage bacteria, particularly Gram-positive bacteria. Pro-sublancin 168 and pre-sublancin 168, are the precursors of sublancin 168. Sublancin 168 is very stable at low pH and can be autoclaved without damage. It does not decompose after 2 years in aqueous solution of about
                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the amino acid sequence of prosublancin 168 used in the method of the invention. The peptide designated sublancin 168, is an antimicrobial useful for treating infections and preserving food against spoilage bacteria, particularly Gram-positive bacteria. Pro-sublancin 168 and pre-sublancin 168, are the precursors of sublancin 168. Sublancin 168 is very stable at low pH and can be autoclaved without damage. It does not decompose after 2 years in aqueous solution of about neutral pH.

                                 This is the amino acid sequence of sublancin 168 used in the method of the invention. The peptide designated sublancin 168, i an antimicrobial useful for treating infections and preserving against spoilage bacteria, particularly Gram-positive bacteria. Pro-sublancin 168 and pre-sublancin 168, are the precursors of sublancin 168. Sublancin 168 is very stable at low pH and can be autoclaved without damage. It does not decompose after 2 years i aqueous solution of about neutral pH.
                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                             To express an androgen receptor fusion protein in E.coli, the pATI expression system was used. The trpE is insoluble so partially purified induced fusion protein is obtained by simply lysing the E.coli and precipitating the insoluble fusion protein. The fusion protein was used for immunisation to obtain monoclonal anti-AR antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence was deduced from a cDNA clone isolated by screening commercially available human testis and prostate lambda gtll cDNA libraries. The sequence is very similar to that of rat AR and in the DNA-binding domain it is identical to that of rAR DNA-binding domain. Homology comparisons with other known steroid receptors indicate that hAR is more closely related to glucocorticoid, mineralo-corticoid and progesterone receptors than to v-erb-A or treceptors for oestrogen, vitamin D and thyroid hormones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1111111111111111
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      15;

                                                                                                                                                                                                                                                                   This invention describes novel pure proapoptotic dependence peptides
which comprise a sequence of an active dependence domain selected from
dependence polypeptides consisting of p75NTR, androgen receptor, DCC,
huntingtin polypeptide, Machado-Joseph disease gene product, SCA1, SCA2,
SCA6 and atrophin-1 polypeptide. The proapoptotic peptides are capable
of inducing cell death and can be used to develop products to mediate or
inhibit apoptosis. The methods can be used for reducing the severity of
a proapoptotic dependence domain mediated pathological conditions e.g.
Huntington's disease, Alzheimer's disease, Kennedy's disease,
Spinocerebellar ataxias, dentatorubropallidoluysian atrophy,
Machado-Joseph disease, stroke or head trauma. They can also be used for
reducing the severity of a pathological condition mediated by upregulated
cell proliferation or cell survival e.g. neoplastic, malignant,
autoimmune or fibrotic conditions. This sequence represents a human
capable described in the method of the invention.
                                                                                                                                                                                                                                                                                              ., sCA1, SCA2, class are capable ducts to mediate or ng the severity of a conditions e reserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4;

```
Androgen receptor protein (AR) is used to produce mono- or poly-clonal antibodies. These are used for the detection and quantification of AR in the presence of endogenous androgen, as androgen will not interfere with binding. They may be used in assays to determine and quantify cellular distribution of AR in tumour tissue, and are esp. useful for evaluating distribution of AR in tumour tissue, and are esp. useful for evaluating
DNA encoding androgen receptor protein - useful for transforming eukaryotic hosts for protein expression and subsequent antibody prodn.
                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Antisense oligonucleotides (see also AAT63200, AAT63404-05) based on an androgen receptor cDNA clone (see also AAT63407) can be used to prevent androgen receptor gene expressic thereby inhibiting the growth or survival of prostatic cells for the treatment of benign prostatic hyperplasia and prostate cancel

This sequence represents the human androgen receptor (AR) amino acid sequence. The invention relates to a fragment of the AR corresponding to amino acids 234-391 (see AAY78913). The fragment mediates amino acids 234-391 (see AAY78913). The fragment mediates androgen-independent activation of the AR. The androgen receptor acts as androgen-responsive genes. Interaction of the AR with the protein kinase independent region. The AR fragment and peptides derived from it can be used as agents for inhibiting androgen independent activation of the androgen receptor, as activation domains, and as a tool for screening androgen receptor, as activation domains, and as a tool for screening for compounds which affect androgen-independent activation of the AR. The peptides, when used in combination with androgen deprivation, effectively limit androgen mediated disease progression. These diseases include cancer, benign prostatic hyperplasia, hirusutism, androgenic cancer. The peptides and nucleic acids encoding them, are especially used the propriet in an inventive in relational disease, especially prostate the primer in relational diseases, especially prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Androgen receptor; AR; androgen-independent activation; inhibitor; cancer; benign prostatic hyperplasia; hirusutism; androgenic alopecia; acne; breast cancer; Kennedy disease; prostate cancer.

Pathological conditions can be diagnosed by determining the presentations in the new protein in a sample or by determining the present mutations in the new genes. Specific uses are described for each and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental

Sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties.

Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein of the invention.

                                                                                                                                                                                           50
                                           Oligos #6 and #7 (AAQ96218 & AAQ96219) are used as primers for the amplification of a 275 bp DNA probe, the internal 269 bp of which corresp. to nts #607 to #865 of AAQ96207, from the BMP-12 encoding plasmid subclone PCR1-1#2. This probe was radioactively labelled and used to screen a murine genomic library. DNA sequence analysis of one of positively hybridising recombinants named MVR3 indicates that it encodes a portion of the mouse gene corresp. to the PCR product mV1 (murine homolog of the human BMP-12 sequence AAQ96207. The partial DNA sequence of this subclone and corresp. AA translation are given in AAQ96223 & AAR78738.

                                                                                                                                                                                                                                                                                                                                                                                                      This polypeptide comprises a fragment of a murine homologue of human bone morphogenetic protein 12 (BMP-12) (see also AAW26589). Its amino acid sequence was deduced from DNA subclone mV1 (see AAT90396), isolated from murine genomic DNA using primers (see AAT90393-94) based on human BMP-12 sequences. Human BMP-12, BMP-13 (see AAW26591) and MP52 (see AAW26590) polypeptides are used in a claimed method for inducing tendon and ligament formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -ELENQKGSGLG--KAQCAALWLQ-CASGGTIGCGGGAVACQN

The invention relates to a chimeric DNA comprising a LNA SCALLE.

C encoding a propeptide from a member of the transforming growth factor

C TGF)-beta superfamily of proteins. This DNA is linked to a DNA sequence

C of Bone Morphogenetic Protein (BMP)-12, BMP-13 or MP52 protein. The DNA

C sequences are useful for producing proteins which induce tendon/ligament

C sequences encoding BMP-12 related proteins with similar activity. The

S sequences encoding BMP-12 related proteins with similar activity. The

proteins are useful for the induction of tendon/ligament-like tissue

formation, wound healing, ligament and other tissue repair, augmenting

the activity of bone morphogenetic proteins, and for treating tendonitis,

carpal tunnel syndrome and other tendon and ligament defects. The

present sequence is murine partial mV1 protein which is homologous to

human BMP-12 or VL-1 sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      encoding (BMP)-12,

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The probes of the invention acid as single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Hum. Mol. Genet. 7:415-422(1998).

Hum. Mol. Genet. 6 a growth regulator and sometosensory information, as well as in face and body structure formation. May also have a role in heart development.

Hum. Mol. Genet. Genet. Genet. 6 and genet. Also surchial arch, highly expressed in striated muscle followed by liver, kidney, testis, brain, heart, lung and spleen.

Hum. Mol. Genet. 6 and Genet. 6 and genet. 6 and genet. 6 by liver, has all processes, eyelid, midbrain, medulla otic region, maxillary and mandibular components of the first branchial arch, nasal processes, eyelid, midbrain, medulla oblongata, limbs, dorsal root ganglia and genital tubercle. Also expressed in non-neuronal structures around the oral cavity and in hip and shoulder regions and in mesenchyme surrounding the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             specifying

Characterization of a murine homeo box gene, Hox-2.6, related to the Drosophila Deformed gene.";
Genes Dev. 2:1424-1438(1988).
C -1- FUNCTION: SEQUENCE-SPECIFIC TRANSCRIPTION FACTOR WHICH IS PART OF A DEVELOPMENTAL REGULATORY SYSTEM THAT PROVIDES CELLS WITH SPECIFIC POSITIONAL IDENTITIES ON THE ANTERIOR-POSTERIOR AXIS.
C -1- SUBCELLULAR LOCATION: Nuclear.
C -1- SIMILARITY: BELONGS TO THE ANTP FAMILY OF HOMEOBOX PROTEINS.
C -1- SIMILARITY: BELONGS TO THE ANTP FAMILY OF HOMEOBOX PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -> APTGRPPCRAVRCMWAG
